

Introducing the Gateway API

Nigel Brown

Freelance Technical Author

Gateway API

The Kubernetes Gateway API is a collection of resources that model service networking in Kubernetes.

Evolution of Ingress

Ingress API was introduced in 2015 and has changed little in the intervening years

Community of users expressed a wish for a more expressive API to implement ingress

Work on the Gateway API commenced in 2019 and reached v1.0 status in 2023

Gateway API is intended to **augment** the capabilities provided by the Ingress API

Role-oriented Configuration

The Gateway API facilitates role-oriented configuration of ingress to Kubernetes clusters.

Infrastructure Provider

Supplies controller capability to enable ingress traffic.

Cluster Administrator

Configures clusters to support the needs of multiple users.

Application Developer

Delivers the app services that clients need to consume.

Traffic Types

North-South

Traffic from outside the cluster for services inside.

East-West

Traffic between services running in the cluster.

Supported Protocols

7	Application	HTTP	gRPC
6	Presentation		
5	Session		
4	Transport	TCP	UDP
3	Network		
2	Data Link		
1	Physical		

OSI Model

Feature Balance

It's not possible to create an API that caters for every feature in every third-party proxy software solution!

Extensible

Gateway API is extensible by design

Filters

- Define how to manipulate traffic
- Custom filters are implementation-specific

Policy attachment

- Alter the values of object fields
- Add new fields to an object by reference

Definitions retain portability

Implementation

```
...
approved.kubernetes.io: https://...
gateway.networking.k8s.io/bundle-versi...
gateway.networking.k8s.io/channel: stand...
creationTimestamp: null
name: gatewayclasses.gateway.networking.k8s.i...
spec:
  group: gateway.networking.k8s.io
  names:
    categories:
    - gateway-api
    kind: GatewayClass
    listKind: GatewayClassList
    plural: gatewayclasses
    shortNames:
    - gc
    singular: gatewayclass
  scope: Cluster
  versions:
    additionalPrinterColumns:
    - jsonPath: .spec.controllerName
      name: Controller
      type: string
    status.conditions
```

Custom Resource Definitions

Gateway Controllers

Custom Resource Definitions

Need to be installed before they can be used

Can be installed alongside a gateway controller

Check the gateway controller's documentation

Gateway API and Kubernetes

Asynchronous Releases

Gateway API release cadence does not follow Kubernetes release cadence.

Supported Versions

Gateway API guarantees to support a minimum of 5 minor Kubernetes versions.

```
apiVersion: apiextensions.k8s.io/v1
kind: CustomResourceDefinition
metadata:
  annotations:
    name: httproutes.gateway.networking.k8s.io
    gateway.networking.k8s.io/bundle-version: v1.0.0
```

Bundle Versions

The 'bundle version' annotation in the CRDs signifies the version of the Gateway API in use

Evolving API

The Gateway API is evolving as it matures in terms of its function.

Gateway API Release Channels

Standard

**Includes resources and fields that
have graduated to GA status**

(e.g., v1)

Experimental

**Standard channel + alpha versions of
other resources and new fields**

(e.g., v1alpha2)

```
apiVersion: apiextensions.k8s.io/v1
kind: CustomResourceDefinition
metadata:
  annotations:
    name: httproutes.gateway.networking.k8s.io
    gateway.networking.k8s.io/bundle-version: v1.0.0
    gateway.networking.k8s.io/channel: experimental
```

Channel Annotation

The 'channel' annotation in the CRDs signifies the release channel in use for the CRD

Demo

Installing the Envoy Gateway as a Gateway Controller

- Check versions
- Use Helm to install the Envoy Gateway
